

Project Design Phase
Proposed Solution Template

Date	02 October 2026
Team ID	SWTID-2026-8568
Project Name	Auto-Ticket Classification Using Flow Designer
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	The school IT helpdesk receives many support requests every day from students and teachers about network connectivity, hardware failures, account access problems and system performance. IT staff currently review each ticket by hand to identify the issue type, choose the Category and Subcategory, and inform the caller that a ticket was created. This manual process is time-consuming, error-prone and does not scale as the number of requests grows.
2.	Idea / Solution description	A student only enters the Caller Name and Short Description. A Flow Designer flow then runs on ticket creation, scans the Short Description for keywords and sets the Category and Subcategory automatically: WiFi → Category = Network, Subcategory = WiFi Projector → Category = Hardware, Subcategory = Projector Password / Login → Category = Access, Subcategory = Forgot Password Slow / Hanging → Category = Performance, Subcategory = Slow Computer The caller is informed that the ticket has been created.
3.	Novelty / Uniqueness	Callers no longer pick a Category or Subcategory; the ticket classifies itself from the words they write. Built entirely with ServiceNow Flow Designer: no-code, no custom scripts and no external tools. Classification rules are consistent and transparent, so every similar issue is handled the same way.

4.	Social Impact / Customer Satisfaction	Students and teachers get faster ticket handling and less waiting for IT help, so classroom disruptions from WiFi, projector, login or slow-computer issues are resolved sooner. Callers receive confirmation that their ticket was created, and tickets are routed consistently. IT staff are freed from repetitive triage and can focus on resolving issues.
5.	Business Model (Revenue Model)	Internal tool for the school, not a commercial product, so there is no direct revenue stream. The value is cost and time savings: less manual triage effort per ticket, built on the existing ServiceNow platform with no custom development or extra tooling.
6.	Scalability of the Solution	The flow handles a growing number of tickets without adding IT staff, since classification is automatic. New issue types can be added by extending the keyword conditions in Flow Designer, with no coding. The same flow can be reused for other departments or campuses on the same ServiceNow instance.
